While this squirrel is predictably short-lived, you can see how a few parameters drastically change the behavior of the squirrel. Next time, we'll put it all together into a genetic algorithm that looks to evolve a squirrel that can grab the acorn and go to the tree without getting eaten by the dog.

Analysis of the wild-type gray and melanic squirrel sequences revealed a 24 base-pair in-frame deletion (MC1R- $\Delta$ 24) in all the melanic squirrels at amino acid positions 87–94. We have named the wild-type allele E + and the melanic allele E B. The complete sequence for both alleles can be found on GenBank accession numbers EU604830 and EU604831.

Thus, based on the sequence comparison of squirrel monkey CG $\beta$  promoter with marmoset CG $\beta$ , human CG $\beta$  and human LH $\beta$  promoters, we propose a model of the squirrel monkey CG $\beta$  gene and promoter wherein the expression of the gene is governed by two promoters: expression of the squirrel monkey CG $\beta$  gene in the pituitary is driven by a promoter that is found immediately upstream of exon 1, and contains a TATA-box, and cis-elements important for pituitary-specific expression; on the other hand ...
