Table of Contents: Assembly rules and restoration ecology

Restoration ecology is the scientific study supporting the practice of ecological restoration, which is the practice of renewing and restoring degraded, damaged, or destroyed ecosystems and habitats in the environment by active human intervention and action. Effective restoration requires an explicit goal or policy, preferably an unambiguous one that is articulated, accepted, and codified.

Community assembly theory suggests that because it's random chance which species will arrive in an area first, this random chance determines which species will dominate the landscape later.

Assembly rules refer to the ecological principles that guide the 'assembly' of ecosystems. They offer guidance on planning which species should be restored first, and then which should be added in which order. This work explores the concepts and theories relating to assembly rules.

Functional trait-based approaches may be useful for understanding both community assembly and ecosystem functioning during restoration. Restoration ecology has typically focused on reinstating particular sets of species (Brudvig 2011) and this focus on taxonomic composition may limit generalization between restorations (Palmer, Ambrose & Poff 1997; Temperton 2004). Traits may provide insights into community assembly mechanisms to move beyond this idiosyncrasy.
